## How Does Laser Phototherapy Work?

### Theradome's targeted lasers

Deliver a precise dose of energy to your hair follicles, bio-stimulating your mitochondria (the "power plants" of your cells) in order to stop hair loss, thicken hair follicles, and grow new hair.

### A precise wavelength proven to get results

Theradome helmets are specifically engineered to deliver laser light at 680 nm wavelengths, the gold standard in stimulating hair growth, according to the Swedish Laser Medical Society.

Most other LPT devices do not meet this same standard and some don't even use real lasers at all, relying on cheap LEDs instead.

### What's the difference between LASERS and LEDs?

#### Medical Grade LASERS

Theradome medical grade LASERS penetrate the scalp up to 5mm for maximum follicle stimulation, more than any other at home laser hair growth device.

#### LEDs

Some laser hair loss products use LEDs. LED beams diverge without reaching the base of hair follicles.
